1.0 Introduction

1.1 Purpose

Travel Compass is designed to give people a good, reliable platform to discover new destinations and plan trips. Instead of getting information from different websites, they can find all information about a place in one website. This website is used to make trip planner faster, simpler and more organised for anyone.

1.2 Scope

The scope of this project includes building a multi-page website Travel Compass that covers all the information of a specific place:

- Home
- Destinations
- Itinerary Planner
- Reviews
- About Us
- Contact Us
- Profile

1.3 Stack Description

- The project uses the follow technologies for development:
- Frontend: HTML, CSS, JavaScript
- Backend: PHP
- Database: MySQL
- External Services: Google Maps API (to display location of a place)
- Others: VS Code, Developer Tools

2.0 Overall Description

2.1 Requirement

Travel Compass website provides a platform that both public visitors and registered users can access. It provides complete information about a place – tourist attractions, best time to travel, tips, and images all in one place. Registered users will be able to make, edit and save itineraries across multiple destinations. Admins will be able to use tools to add and update information about a place, moderate reviews, and maintain website content without needing technical expertise.

2.2 Module Description

Travel Compass website consists of the following modules:

- Home – Overview, featured destinations
- Destinations – All places with info, images, and maps
- Itinerary Planner – Tools to plan and organize a trip
- Reviews – User submitted reviews of places that they have visited
- About Us – Information about the creators of the website
- Contact Us – Contact details, Support
- Profile – User's data
- Admin Panel - Manage website content, place content and moderate reviews.

2.3 Sub – Modules Description

- Login/ Signup: Users can register or log in into the website.
- User Profile: Users can view their personal info and travel preferences.
- Saved Itineraries: Users can view, edit or delete their saved itineraries.

3.0 Functional Requirements

3.1 Software Requirements

This website requires a server capable of running dynamic websites. The frontend of the website is built using HTML, CSS, and JavaScript and the backend is built using PHP. MySQL is used to store and manage the website's data. The website must be compatible with modern web browsers.

3.2 Hardware Requirements

To handle the traffic, a server with at least 8 GB ram, 4 core CPU and 50 GB is required. For development, a laptop with 8 GB ram, 4 core CPU, and 20 GB of free storage space is required.

3.3 User Requirements

Users should be able to login/ signup in the website, search for various tourist destinations and compare them, and make a itinerary. Admins should be able to add, edit and remove content in the website.

4.0 Table Description (Database Schema)

Module	Sub-Module	Description	User Type
Home	—	Overview of the website and featured destinations	Visitor
Destinations	—	Browse and search destinations by location, category, or budget.	Visitor, Registered User
Destinations	—	Place images, description, map, and best time to visit.	Visitor, Registered User
